

## Thrombocytopenia

### Definition

Platelet count  $<150 \times 10^9/L$ . 2.5% of the normal population will have a platelet count lower than this. A recent fall in platelets by 50% may be abnormal even if the count is within the normal range.

**Table 1 Common causes of thrombocytopenia**

<b>Causes of thrombocytopenia</b>
<b>Pseudothrombocytopenia</b> (caused by Platelet clumping due to EDTA antibodies or failing to count large platelets)
<b>Decreased production of platelets</b>
Alcohol
Drugs (Gold, H <sub>2</sub> -antagonists, diuretics, oral hypoglycaemics, digoxin)
Vitamin B12 and folate deficiencies
Infection: Viral (HIV)
Chemotherapy /radiotherapy
Haematological:
<ul style="list-style-type: none"> <li>Bone marrow infiltration (leukaemia, lymphoma, myeloma &amp; metastases)</li> <li>Myelodysplasia</li> <li>Aplastic anaemia</li> </ul>
<b>Increased platelet destruction</b>
Infective:
<ul style="list-style-type: none"> <li>Bacterial (streptococcus, tuberculosis, Helicobacter pylori)</li> <li>Viral (EBV, Hepatitis C, HIV, Rubella, Varicella Zoster virus)</li> <li>Protozoan (malaria)</li> </ul>
Drugs (heparin, quinine, Valproic acid)
Massive Haemorrhage +/- Transfusion
Immune thrombocytopenia
Thrombotic Thrombocytopenic purpura (TTP) & Haemolytic uraemic syndrome (HUS)
<b>Distributional (splenomegaly)</b>
<b>Liver Disease</b>

### Important features of the history and examination

*South West Strategic Clinical Network*

*Somerset, Wiltshire, Avon and Gloucestershire (SWAG) Cancer Services*

- Review any newly started medication
- Ask about recent infections
- Ask about risk factors for HIV and Hepatitis C
- Assess alcohol history
- Are there any constitutional symptoms suggestive of malignancy (fever, weight loss, night sweats)
- Assess for features of liver disease
- Assess for lymphadenopathy

### **Initial investigations**

- Repeat the FBC (In the presence of platelet clumping a citrated sample is more accurate)
- Request a blood Film
- Coagulation screen

## Management

**Table 2 Management of thrombocytopenia**

Platelet count & history/investigations	Action
<p><b>50-150 x10<sup>9</sup>/l</b>  <b>AND</b>                      isolated thrombocytopenia, normal blood film,                      no lymphadenopathy                      no constitutional symptoms</p>	<p>Repeat bloods in 6 weeks.</p> <p>If FBC unchanged, monitor in primary care every 4 months to ensure no deterioration or other abnormalities become apparent</p> <p>Patients should present if new bleeding or bruising or constitutional symptoms occur</p>
<p><b>&lt;150 x 10<sup>9</sup>/l</b>  <b>AND</b>                      Constitutional symptoms/                      lymphadenopathy/splenomegaly/                      abnormal blood film</p>	<p>Refer to haematology</p>
<p><b>&lt;50 x10<sup>9</sup>/L</b>  <b>OR</b>                      symptomatic isolated thrombocytopenia                      (petechial rash, purpura, mucosal bleeding in the absence of constitutional symptoms)</p>	<p>Review medication for drug induced thrombocytopenia</p> <p>Refer to haematology if ITP appears more likely</p>
<p><b>&lt;20 x10<sup>9</sup>/L</b>  <b>OR</b>                      severe bleeding or red cell fragments or blasts on the peripheral blood film</p>	<p>Contact haematology immediately</p>
